\* CDC adopted a change in case definition in 2008. In addition to "Confirmed" cases, the "Probable" category was reported out for the first time. 2015 numbers above use the "Total" category reported by CDC (confirmed plus probable).  
 US 2015 confirmed = 28,453 / probable = 9,616. In 2011, CDC changed case definition to include positive CSF antibody tests.

Note: CDC has stated, and confirmed in 2013, that only 10% of Lyme disease cases meeting the surveillance definition are reported – for example, if 30,000 cases are reported, 300,000 cases occurred (number does not include all the cases falling outside the stringent surveillance case definition).
